-! FUNCTION: IN RESPONSE TO THE PRESENCE OF ALLERGENS, THIS PROTEIN DIRECTLY PROMOTES THE ACCUMULATION OF EOSINOPHILS (A PROMINENT FEATURE OF ALLERGE INFLAMMATORY REACTIONS), BUT NOT LYMPHOCYTES, MACKOPHAGES OR NEUTROPHILS.

-! SUBCELLUIAR LOCATION: EXTRACELUIAR.
-! TISSUE SPECIFICITY: EXPRESSED CONSTITUTIVELY IN THE THYMUS.
EXPRESSION INDUCIBLE IN THE LUNG (TYPE I ALVEOLAR EPITHELIAL CELLS), INTESTINE, HEARY, SPLEEN, KIDNEY.
-! INDUCTION: BY INTERPERON-GAMMA AND LIPOPOLYSACCHARIDE (LPS).
-! SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOKINE C-C) (CHEMOKINE CC).
                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ROTHENBERG M.E., LUSTER A.D., LEDER P.,

T2:398-405(1994).

-i- FUNCTION: IL-8 IS A CHEMOTACTIC FACTOR THAT ATTRACTS NEUTROPHILS, PAROPILIS, AND T-CELLS, BUD TO MONOCYTES. IT IS ALSO INVOLVED IN NEUTROPHIL ACTIVATION. IT IS RELEASED FROM SEVERAL CELL TYPES IN RESPONSE TO AN INFLAMMATORY STIMULUS.

J. BIOL. CHEM. 266:8455-8463(1991).

-!- FUNCTION: IL-8 IS A CHEMOTACTIC FACTOR THAT ATTRACTS NEUTROPHILS,
BASOPHILS, AND T-CELLS, BUT NOT MONOCYTES. IT IS ALSO INVOLVED IN
RESPONSE TO AN INTEAMMATORY STIMULUS.
-!- SUBUNIT: HOMODIMER.
-!- TISSUE SPECIFICITY: ALVEOLAR MACROPHAGES.
-!- INDUCTION: BY LIPOPOLYSACCHARIDE.
-!- SIMILARITY: BELONGS TO THE INTERCRINE ALPHA FAMILY (SMALL CYTOKINE
C-X-C) (CHEMOKINE CXC).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MEDLINE, 93041741.

Post-processing: Minimum Match 0% Listing first 45 summaries

pir60 1:pir1 2:pir2 3:pir3 4:pir4 Database:

Mean 25.732; Variance 40.739; scale 0.632 Statistics:

pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This protein is a polymorphonuclear leukocyles chemotactic factor
and is involved in the host defense function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                               purified heparanses, prepared under reducing conditions and purified heparanses, prepared under reducing conditions and activated with transglutaminase, are given in R70786-804. Most are prepared by reverse transcription of mRNA from activated human leukocytes, then cloning of the cDNA into pVL1392 baculovirus vector, and expression in Sf9 cells in the presence of reduced glutathione and dithiothreitol.
                                                                                                                                                                                                                                                          Screening for cods. with anti-heparanase activity - by detecting inhibition of heparin or heparan sulphate degradation, potentially useful for treating arthritis, restenosis, cancer. Claim 13; Page 53; 60pp; English.

Treatment of viral infection, e.g. HIV, and in wound healing of claim i. Page 12-13; 21pp; English.

This protein comprises human beta-chemokine HI305, also known as This protein comprises human beta-chemokine HI305, also known as This protein comprises human beta-chemokine HI305, also known as Claim i. Page 12-13; 21pp; English.

MCP-2. Its sequence was deduced from a claimed cDNA clone (see CDNA library. Also claimed are: (1) a host cell, preferably mammalian, transformed with a HI306 polynucleotide operably linked to an expression control sequence; (2) a recombinantly produced Specifically reacts with the HI305 protein. The HI305 protein and (3) a composition for the treatment of a mammalian subject (claimed). It is thought to have chemokine activities and canby be used in a composition for the treatment of any therefore have an effect on chemotraxis or migration of blood including replication of HIV, and may also be used for treatment of calls. It may be useful for inhibiting viral replication, wounds and to raise monoclonal and polyclonal antibodies which therefore the nation of HIV, and may also be used for treatment of specifically react with HI305. Such antibodies may be used for the protein from the nation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New human monocyte chemotactic proprotein - has homology to CC chemokine(s) useful for identifying agent for treating auto-immune diseases or allergic responses.

Claim ; Pages 38-39; 53pp; English.

The is a human monocyte chemotactic proprotein sequence. Its cDNA was first identified in Incyte clone 95517 from a breast cDNA library. Antisense nucleotides can be used to control human MCPP expression especially where it may lead to inappropriate monocyte or macrophage activity causing damage associated with allergic responses to organs such as the lungs. Antisense nucleotides and MCPP cDNA may be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0; Gaps

Products for treating e.g. cancers, infections, asthma, cystic fibrosis, rhinitis, atheroscierosis or inflammatory bowel disease can produce represents murine monocyte chemoattractant protein 5 (MCP-5). The MCP-4 and MCP-5 have activity in stimulating chemotactic cactivity. The proteins can be used for treating cancers, e.g. a cirrity. The proteins a lump or gastrointestinal tract, or car be used for treating or astrointestinal tract, or infectious disease such as AIDS or malaria. Antagonists to the proteins can be used for treating e.g. asthma, chronic obstructive pulmonary can be used for treating e.g. asthma, chronic obstructive pulmonary concerns concerns and the proteins concerns and the proteins concerns and the colerosis, infinitis, atherosclerosis, continuore phritis, multiple sclerosis, infinitis, atherosclerosis, contractions may also be treated with a molecule that inhibits where the concerns and concerns
in diagnostic assays of body fluids or biopsied tissues to detect expression levels of MCPP. MCPP cDNA may also be useful for treatment of disorders such as asthma, rheumatoid arthritis, NIDDM or cancer of the breast or bladder. Human MCPP protein can be used to MCPP in allergic responses or inhibitors to modulate the activity of Sequence 109 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             17-AUG-1998 (first entry)
Murine monocyte chemoattractant protein 5.
Murine; mouse; monocyte chemoattractant protein; MCP-4; MCP-5; chemokine; immune response; cancer; AIDS; malaria; parasitic infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mouse monocyte chemotactic protein 5. Mouse; murine; monocyte chemotactic protein 5; MCP-5; mMCP-5; diagnosis; immune system disorder; infection; inflammation; allergy; tumour;

Monocyte chemotactic protein-5 - used to develop products for treating e.g. immune system disorders, infections, inflammation, treating e.g. immune system disorders, infections, inflammation, allergy cardiovascular disease or tumours

Claim 28; page 79; 101pp; English.

Claim 28; page 79; 101pp; English.

The present sequence represents monocyte chemotactic protein 5 (MCP-5).

The MCP-5 protein stimulates chemotaxis of eosinophils, monocytes and consinophil. monocyte-and/or lymphocyte-mediated inflammations.

Consinophil. monocyte-and/or lymphocyte-mediated inflammations.

Consinophil. monocyte-and/or lymphocyte-mediated inflammations.

Consinophil. monocyte-and/or lymphocyte-mediated inflammations.

Consinophil. monocyte-and/or lymphocyte-mediated inflammation.

treat rheumatoid arthritis, autoimmune, chronic inflammatory or infectious diseases, allergies, prostaglandin dependent fever and bone marrow failure, silicosis, sarcoidosis, hyper-eosinophilic syndrome, ung inflammation and atherosclerosis. Ck betal0 cDNA can be used to isolate genes encoding similar peptides, in gene therapy and for chromosome identification.
                                                                                                     Gaps

Example 11; Fig 5: 83pp; English.

Example 11; Fig 5: 83pp; English.

The present sequence is human chemokine betal0 (Ck betal0) or monocyte chemotractic protein 4 (MCP-4) Bac 3 variant, which can be used to treat betalow while ack betalo.

The present sequence oxcessive levels of Ck betalo.

The present can be used to reduce excessive levels of Ck betalo.

The promotes wound healing, regulates haematopoies asthma, fibrotic or should healing, regulates haematopoies and generates antibodies. Labelled Ck betalo can be used to identify its cognate compounds for (arb) agonist activity. The antagonist can be used to screen treat rheumatoria arthritis, autoimmune, chronic inflammatory or infectious diseases, allergies, prostaglandin dependent fever and syndrome, lung inflammation and atherosclerosis. Ck betalo CDNA can and for chromosome identification.

The used to isolate genes encoding similar peptides, in gene therapy or sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0; Gaps

                 19-MAR-1998 (first entry)
Bac 3 chemokine betal0 or monocyte chemotactic protein 4 variant. Human; chemokine betal0 or keal0, treatment; antagonist; solid tumour; infection; autoimmune disease; asthma; antibody; fibrotic disease; psoriasis; neurodegenerative disease; wound healing; haematopoiesis regulation; gene therapy; chromosome identification; monocyte chemotactic protein 4; neuronist, MCP-4; Bac 3 variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (HUMA-) HUMAN GENOME SCI INC.

Example 11; Fig 5; 83pp; English.

The present sequence is human chemokine betal0 (Ck betal0) or monocyte chemotactic protein 4 (MCP-4) Bac 2 variant, which can be used to treat patients deficient in Ck betal0, while a Ck betal0 attagonist can be used to treat leukaemia, solid tumours, chronic or betal0 can be used to treat leukaemia, solid tumours, chronic or opportunistic infections, autoimmune diseases. It also diseases, psoriasis and neurodegenerative diseases. It also promotes wound healing, regulates haematopoiesis and generates antibodies. Labelled Ck betal0 can be used to identify its cognate compounds for carbigatomist activity. The antagonist can be used to screen treat rheumatoid arthritis, autoimmune, chronic inflammatory or bone marrow failure, silicosis, sarcoidosis, hyper-eosinophilic be used to isolate genes encoding similar peptides, in gene therapy confidence. The chromosome identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 11; Fig 5: 83pp; English.

The present sequence is human chemokine betal0 (Ck betal0) or monocyte chemotractic protein 4 (MCP-4) Drol1/2 variant, which can monocyte chemotractic protein 4 (MCP-4) Drol1/2 variant, which can be used to treat leukaemia, solid tumours, chronic or betal0 can be used to treat leukaemia, solid tumours, chronic or opportunistic infections, autoimmend diseases. It also diseases, psoriasis and neurodegenerative diseases. It also promotes wound healing, regulates haematopoiesis and generates antibodies. Labelled Ck betal0 can be used to identify its cognate compounds for (art)agonist activity. The antagonist can be used to creeptor, while cells expressing the receptor can be used to screen treat rheumatoid arthritis, autoimmune, chronic inflammatory or infectious diseases, allergies, prosteglandin dependent fever and syndrome, lung inflammation and atherosclerosis. Ck betal0 cDNA can can gent to isolate genes encoding similar peptides, in gene therapy contracts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0; Gaps

The present sequence represents a chemokine, CKbeta-10, which is capable of mobilising stem cells. The chemokine can be used therapeutically to improve stem cells. The chemokine can be used therapeutically to stimulating factor or other haematoregulatory agent. It can be used wherever an increased level of haematopoietic cells is needed, e.g. to increase the immune response to chronic infection (particularly patients with reduced bone marrow function as a result of mannatosuppressive treatment or disease, and to provide more rapid immunosuppressive treatment or disease, and to provide more rapid regeneration of bone marrow after treatment for neoplastic or viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        diseases. The induced stem cells may be harvested for subsequent return to the patient, optionally after they have been genetically manipulated to deliver a selected gene product (gene therapy). The cells may be co-administered with a cytotoxic drug.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      healing, regulates haematopoiesis and generates antibodies.
Labelled Ck betail can be used to identify its cognate receptor,
while cells expressing the receptor can be used to screen compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      claim 1; Fig 2; Bapp, English.

The present sequence is human chemokine betal0 (Ck betal0) or the present sequence is human chemokine betal0 (and be used to treat monocyte chemotactic protein 4 (MCP-4), which can be used to reduce excessive levels of Ck betal0 antagonist can be used to reduce excessive levels of Ck betal0. Ck betal0 can be used to retar leukaemia, solid tumours, chronic or opportunistic used to treat leukaemia, solid tumours, chronic or opportunistic infections, autoimmune diseases, asthma, fibrotic diseases, psoriasis and neurodegenerative diseases. It also promotes wound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polypeptide encoding chemokine beta 4 and monocyte chemotactic protein 4 - useful to treat tumours, autoimmune disease, infection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human chemokine betal0 or monocyte chemotactic protein 4.

Human chemokine betal0 or monocyte chemotactic protein 4.

Human; chemokine betal0, Ck betal0; treatment; antagonist;

Solid tumour; infection; autoimmune disease; asthma; antibody;

Fibrotic disease; psoriasis; neurodegenerative disease;

wound healing; haematopoiesis regulation; gene therapy;

chromosome identification; monocyte chemotactic protein 4;

leukaemia; MCP-4.
                         WPI: 97-258956/23.
WPI: 97-258956/23.
Ten new chemokine(s) able to mobilise stem cells - used where Increased levels of haematopoietic cells are required, e.g. to increase resistance to infection claim 7; Page 11-12; 24pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 87; DB 24; Length 82; Pred. products for treating e.g. cancers, infections, asthma, cystic fibrosis, rhinitis, atherosclerosis or infections, asthma, cystic claim 8; page 53; 106pp; English.

The present sequence represents human monocyte chemoattractant protein (WCP-4). The MCP-4 and MCP-5 have activity in stimulating chemotactic activity. The Proteins can be used for treating cancers, e.g. a sarrooma, a tumour within the lung or gastrointestinal tract, or sarrooma, a tumour within the lung or gastrointestinal tract, or can be used for treating e.g. ablanca as a first of the proteins of sarrooms, a such as AlbS or malaria. Antagonists to the proteins can be used for treating e.g. asthma, chronic obstructive pulmonary glomerulonephritis, multiple sclerosis, inflammatory bowel disease, arthritis or adult respiratory distress syndrome. Infections such as MCP-4 or MCP-5 expression.
                                                                                                                                                                                                   ö

for (ant)agonist activity. The antagonist can be used to treat infectious diseases, allergies, prostaglandin dependent fever and bone marrow failure, silicosis, sarcoidosis, hyper-eosinophilic syndrome, lung inflammation and atherosclerosis. Ck betal0 cDNA can be used to isolate genes encoding similar peptides, in gene therapy and for chromosome identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Monocyte chemoattractant proteins, MCP-4 and MCP-3 - used to develop

This polypepticae comprises numan macrophage-derived monocyte chemotactic protein-5 (MCP-5), a novel C-C chemokine. Its amino acid sequence was deduced from a cDNA clone (see 190880 and T90883) isolated from a human macrophage cDNA library. A claimed method for producing MCP-5 comprises culturing a host cell that is stably transformed or transfected with McP-5 polynucleotide. Also claimed is a hybridoma that produces a monoclonal antibody (MAb) that is specifically reactive with the mature MCP-5. MCP-5 (or its analogues and produces a monoclonal antibody (MAb) that is specifically reactive with the mature MCP-5. MCP-5 (or its analogues and wounds or infections, while its inhibitors (e.g. the MAb) are useful as anti-inflammatories in cases of e.g. arthritis and angiogenesis and tumour growth (or metastasis). The MCP-5 inhibitors can possibly also be used to reduce the damaging effects inhibit replication of HIV. MCP-5 can also be used to identify and thibit replication of HIV. MCP-5 can also be used to identify ceeptors) are used to modulate MCP-5 peptides (or the analogues or mananes as an analogues or seminanes and antagonists.
